For the first time in the history of space exploration, scientists have measured the seasonal changes in the gases that fill the air directly above the surface of Gale Crater on Mars. As a result, they noticed something baffling: oxygen, the gas many Earth creatures use to breathe, behaves in a way that so far scientists cannot explain through any known chemical processes.

Over the course of three Mars years (or nearly six Earth years) an instrument in the Sample Analysis at Mars (SAM) portable chemistry lab inside the belly of NASA's Curiosity rover inhaled the air of Gale Crater and analyzed its composition. The results SAM spit out confirmed the makeup of the Martian atmosphere at the surface: 95% by volume of carbon dioxide (CO₂), 2.6% molecular nitrogen (N₂), 1.9% argon (Ar), 0.16% molecular oxygen (O₂), and 0.06% carbon monoxide (CO). They also revealed how the molecules in the Martian air mix and circulate with the changes in air pressure throughout the year. These changes are caused when CO₂ gas freezes over the poles in the winter, thereby lowering the air pressure across the planet following redistribution of air to maintain pressure equilibrium. When CO₂ evaporates in the spring and summer and mixes across Mars, it raises the air pressure.

Within this environment, scientists found that nitrogen and argon follow a predictable seasonal pattern, waxing and waning in concentration in Gale Crater throughout the year relative to how much CO₂ is in the air. They expected oxygen to do the same. But it didn't. Instead, the amount of the gas in the air rose throughout

spring and summer by as much as 30%, and then dropped back to levels predicted by known chemistry in fall. This pattern repeated each spring, though the amount of oxygen added to the atmosphere varied, implying that something was producing it and then taking it away.

"The first time we saw that, it was just mind boggling," said Sushil Atreya, professor of climate and space sciences at the University of Michigan in Ann Arbor. Atreya is a co-author of a paper on this topic published on November 12 in the *Journal of Geophysical Research: Planets*.

As soon as scientists discovered the oxygen enigma, Mars experts set to work trying to explain it. They first double- and triple-checked the accuracy of the SAM instrument they used to measure the gases: the Quadrupole Mass Spectrometer. The instrument was fine. They considered the possibility that CO₂ or water (H₂O) molecules could have released oxygen when they broke apart in the atmosphere, leading to the short-lived rise. But it would take five times more water above Mars to produce the extra oxygen, and CO₂ breaks up too slowly to generate it over such a short time. What about the oxygen decrease? Could solar radiation have broken up oxygen molecules into two atoms that blew away into space? No, scientists concluded, since it would take at least 10 years for the oxygen to disappear through this process.

"We're struggling to explain this," said Melissa Trainer, a planetary scientist at NASA's Goddard Space Flight Center in Greenbelt, Maryland who led this research. "The fact that the oxygen behavior isn't perfectly repeatable every season makes us think that it's not an issue that has to do with atmospheric dynamics. It has to be some chemical source and sink that we can't yet account for."

To scientists who study Mars, the oxygen story is curiously similar to that of methane. Methane is constantly in the air inside Gale Crater in such small quantities (0.00000004% on average) that it's barely discernable even by the most sensitive instruments on Mars. Still, it's been measured by SAM's Tunable Laser Spectrometer. The instrument revealed that while methane rises and falls seasonally, it increases in abundance by about 60% in summer months for inexplicable reasons. (In fact, methane also spikes randomly and dramatically. Scientists are trying to figure out why.)

With the new oxygen findings in hand, Trainer's team is wondering if chemistry similar to what's driving methane's natural seasonal variations may also drive oxygen's. At least occasionally, the two gases appear to fluctuate in tandem.

"We're beginning to see this tantalizing correlation between methane and oxygen for a good part of the Mars year," Atreya said. "I think there's something to it. I just don't have the answers yet. Nobody does."

Oxygen and methane can be produced both biologically (from microbes, for instance) and abiotically (from chemistry related to water and rocks). Scientists are considering all options, although they don't have any convincing evidence of biological activity on Mars. Curiosity doesn't have instruments that can definitively say whether the source of the methane or oxygen on Mars is biological or geological. Scientists expect that non-biological explanations are more likely and are working diligently to fully understand them.

Trainer's team considered Martian soil as a source of the extra springtime oxygen. After all, it's known to be rich in the element, in the form of compounds such as hydrogen peroxide and perchlorates. One experiment on the Viking landers showed decades ago that heat and humidity could release oxygen from Martian soil. But

that experiment took place in conditions quite different from the Martian spring environment, and it doesn't explain the oxygen drop, among other problems. Other possible explanations also don't quite add up for now. For example, high-energy radiation of the soil could produce extra O₂ in the air, but it would take a million years to accumulate enough oxygen in the soil to account for the boost measured in only one spring, the researchers report in their paper.

"We have not been able to come up with one process yet that produces the amount of oxygen we need, but we think it has to be something in the surface soil that changes seasonally because there aren't enough available oxygen atoms in the atmosphere to create the behavior we see," said Timothy McConnochie, assistant research scientist at the University of Maryland in College Park and another co-author of the paper.

The only previous spacecraft with instruments capable of measuring the composition of the Martian air near the ground were NASA's twin Viking landers, which arrived on the planet in 1976. The Viking experiments covered only a few Martian days, though, so they couldn't reveal seasonal patterns of the different gases. The new SAM measurements are the first to do so. The SAM team will continue to measure atmospheric gases so scientists can gather more detailed data throughout each season. In the meantime, Trainer and her team hope that other Mars experts will work to solve the oxygen mystery.

"This is the first time where we're seeing this interesting behavior over multiple years. We don't totally understand it," Trainer said. "For me, this is an open call to all the smart people out there who are interested in this: See what you can come up with."

2019 EurekAlert! Trending Release List the most international ever

EUREKALERT!

VIDEO: THE No. 1 most popular release FEATURED A VIDEO DEMONSTRATING THE ROCKING BED USED IN THE STUDIES.... [view more >](#)

CREDIT: LAURENCE BAYER AND AURORE PERRAULT

The EurekAlert! 2019 Trending Release List is the most geographically diverse to date, with more than half of the top 10 from outside the United States. For the first time, news releases from Japan, Russia, and Norway occupied spots on the annual trending list, joined by returners from Canada and the U.K.

EurekAlert! is a non-profit news release distribution service operated by the American Association for the Advancement of Science (AAAS) as a free resource to journalists and the public. News releases hosted on EurekAlert! are produced and submitted by research institutions and journal publishers and must meet eligibility guidelines for acceptance.

Health-related releases dominated the Trending List, including the year's most popular release about a pair of studies in the journal *Current Biology* on the beneficial effects of the rocking motion on sleep and memory conducted by Swiss scientists. The news release, issued by the publisher Cell Press, received 278,119 views.

The 3rd most popular release of the year described a National Institute of Mental Health study about the Netflix show "13 Reasons Why." It found the release of the show was associated with a 28.9% increase in suicide rates among U.S. youth ages 10-17 in the month following the show's release.

The "femme fatale effect" was put to the test in six experiments and described in the 4th trending release by Washington State University. The research found that attractive businesswomen were considered by study participants to be less trustworthy, less truthful, and more worthy of being fired.

In long-term heterosexual relationships, passion is the only factor that determines the frequency of sex, according to the 5th most-visited release from the Norwegian University of Science and Technology.

Releases about quantum physics cleared the way to the top 10 list for Russia and Japan. The 2nd most popular release described how scientists from Russia, Switzerland and the U.S. returned the state of a quantum computer a fraction of a second into the past. A team of physicists in Japan, meanwhile, teleported quantum information within the confines of a diamond, as described in the 6th most-visited news release of the year.

2019 Trending Releases

Most popular

1. Rocking improves sleep and memory, studies in mice and people show (379,119)
Cell Press, *Current Biology*

2. Physicists reverse time using quantum computer (358,629)
Moscow Institute of Physics and Technology, *Scientific Reports*

3. Release of '13 Reasons Why' associated with increase in youth suicide rates (297,867)
NIH/National Institute of Mental Health, *Journal of the American Academy of Child and Adolescent Psychiatry*

4. Attractive businesswomen viewed as less trustworthy 'femmes fatales' (287,961)
Washington State University, *Sex Roles*

5. Passion trumps love for sex in relationships (261,605)
Norwegian University of Science and Technology, *Evolutionary Behavioral Sciences*

6. Researchers teleport information within a diamond (228,916)
Yokohama National University, *Communications Physics*

7. City trees can offset neighborhood heat islands, Concordia researcher says (217,991)
Concordia University, *Proceedings of the National Academy of Sciences*

8. Stress-free training may enhance surgical skill (214,414)
University of Houston, *Scientific Reports*

9. With Mars methane mystery unsolved, Curiosity serves scientists a new one: Oxygen (202,770)

NASA/Goddard Space Flight Center, *Journal of Geophysical Research: Planets*

10. Commonly prescribed drugs could increase the risk of dementia, says a new study (200,847)

University of Nottingham, *JAMA Internal Medicine*
